

Francisco Alberto Salazar Herrera

SR. DEVOPS ENGINEER

Profile

Senior DevOps Engineer with 8+ years of experience in infrastructure and systems administration for SaaS products. CKA and CKAD certified. Specialized in **GCP and AWS infrastructure** (7+ years of continuous GCP experience), Kubernetes orchestration, Terraform IaC, and CI/CD pipeline optimization (Jenkins, GitHub Actions, GitLab CI, Cloud Build). Proven track record of reducing cloud costs by 30%, accelerating CI/CD execution by 3x, and improving production reliability through monitoring, autoscaling, and security best practices. Experienced in managing Linux servers, application servers, and deploying observability stacks (New Relic, ELK, Grafana, GCP Monitoring).

Employment History

Sr. DevOps Engineer, TeselaGen, Remote (California, USA)

JAN 2024 — PRESENT

- Reduced **cloud costs by 30%** (~\$48K/year saved) through workload rightsizing, autoscaling policies, and storage lifecycle optimization on **GCP and AWS**.
- Optimized **CI/CD pipelines** using **Cloud Build** and GitHub Actions, cutting execution time by **3x** — from 3 hours to 1 hour — accelerating developer feedback loops.
- Reduced **Docker** image sizes by up to **10x** and improved container startup times by **2x**, improving deployment reliability and rollback speed across **GCP Artifact Registry**.
- Implemented **GitOps from scratch** with ArgoCD, establishing a secure, auditable deployment workflow across all environments.
- Built end-to-end **Infrastructure as Code with Terraform** on **GCP and AWS**, standardizing provisioning across dev, staging, and production with reusable modules.
- Managed **GKE and EKS clusters**, configuring autoscaling, node pools, and workload scheduling with **Cloud Scheduler** for batch processing.
- Administered **GCP IAM policies and permissions**, enforcing least-privilege access across teams and service accounts.
- Strengthened **security and compliance** by implementing Vault CSI driver, secret rotation policies, and **container vulnerability scanning**.

Backend & DevOps Engineer, BloomAlert, Remote

FEB 2023 — JAN 2024

- Designed and deployed a **custom monitoring and alerting system** using Grafana, **GCP Monitoring**, and Python, improving alert accuracy and significantly reducing false positives.
- Defined **SLA/SLI/SLO metrics** and integrated observability with **New Relic** and **GCP Monitoring**, enabling proactive incident response and reducing MTTR.
- Provisioned and managed **GCP infrastructure with Terraform**, creating reproducible and version-controlled environments.
- Migrated **20+ ETL pipelines** from Prefect 1.x to Prefect 2.0, improving data pipeline efficiency and maintainability.
- Managed **GCE instances and GCP Load Balancers** for application workloads, ensuring high availability and cost efficiency.
- Coordinated between development and operations teams to ensure **monitoring coverage** and smooth rollout of infrastructure changes.

Software & DevOps Engineer, Caligrafix, Remote

JUN 2021 — FEB 2023

- Implemented a **customized Kubernetes VPA** on **AWS EKS** for production database clusters, ensuring high availability under variable load.
- Integrated **Cluster Autoscaler with VPA**, dynamically scaling **EC2** compute resources and improving cloud cost efficiency.
- Developed an **automated AWS EBS volume resizing tool** for Kubernetes, preventing storage outages and eliminating manual intervention.
- Built **CI/CD pipelines with GitLab CI and Jenkins**, improving release velocity and reducing deployment failures.
